FloTHERM simulation

Project support from simulation software

FloTHERM simulation software allows to detect hot spots and problem areas from the concept phase.

Cooling concepts for assemblies through to complete case/cabinet systems can thus be analysed in advance.

Our FloTHERM experts support you in developing your concept.

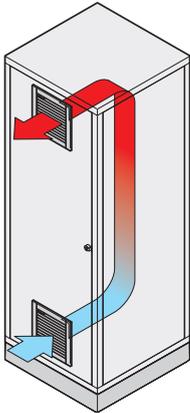

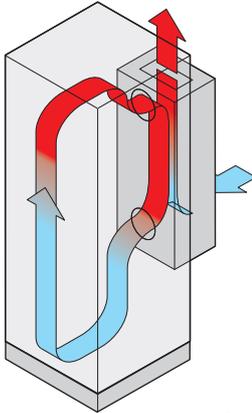

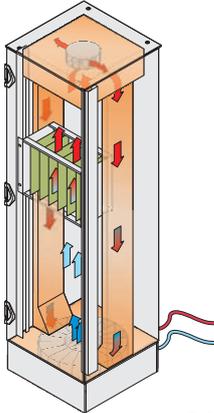

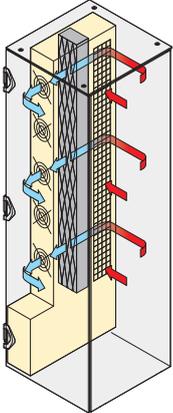

Your advantage:

- Extensive analyses eliminate problems during the concept/prototype phase
- Short development times
- High performance and reliability for your systems

Climate control - 19" fan trays

01102012

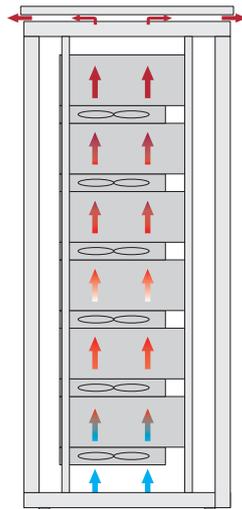

Standards/Approvals

■ 19" assembly area in accordance with:
IEC 60297-3-101

■ Mechanical protection to DIN EN ISO 13857
Contact protection to DIN EN ISO 13857
Electrical safety to EN 60335 part 1
Plastics self-extinguishing to UL 94 V0

Airflow

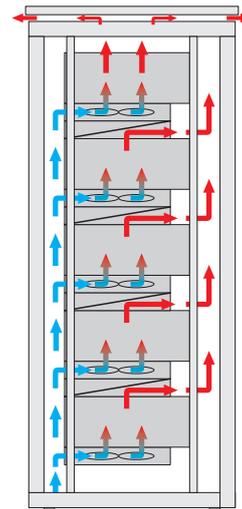

**Vertical airflow
(continual warming)**

01109055

With vertical airflow the air becomes steadily warmer as it rises through the cabinet.

**Diverted airflow
(effective cooling)**

01109054

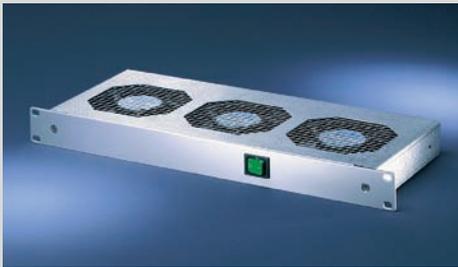

By using the 1 U airflow element, air is introduced from the front and extracted to the rear. Now all sub-assemblies receive the same cooling air.

Climate control – 19" fan trays

19" fan dimensioning

For local heat dissipation, the airflow volume required to expel the heat produced is calculated.

Note

The cabinet ventilation is not taken into account here. The required airflow volume is calculated as follows:

$$V = (f \times P_v) / \Delta T$$

The air constant $f = 3.3$ m³K/Wh.

ΔT is the temperature difference between the ambient temperature of the sub-assembly and that of the air drawn in.

Example of readings

- $P_v = 600$ W
- air sucked in: 25 °C
- permissible ambient temperature of the sub-assembly = 30 °C

1. $\Delta T = T_i - T_u = 30$ °C – 25 °C = 5 K
2. From $P_v = 600$ W to the curve for $\Delta T = 5$ K
3. From the intersection point to the airflow volume $V = 400$ m³/h

Climate control – Air filtered fans

Air filtered fan calculations

To establish the size of the air-filtered fan required, calculate the air throughput necessary to dissipate the amount of heat contained in the cabinet.

The necessary airflow volume (at sea level) is calculated thus:

$$V = f \times (P_V - P_S) / \Delta T \text{ with}$$

V = airflow volume

f = air constant = 3.3 m³ K/Wh

P_V = thermal power loss

(sum of heat emitted by the equipment in the cabinet)

P_S = radiant power

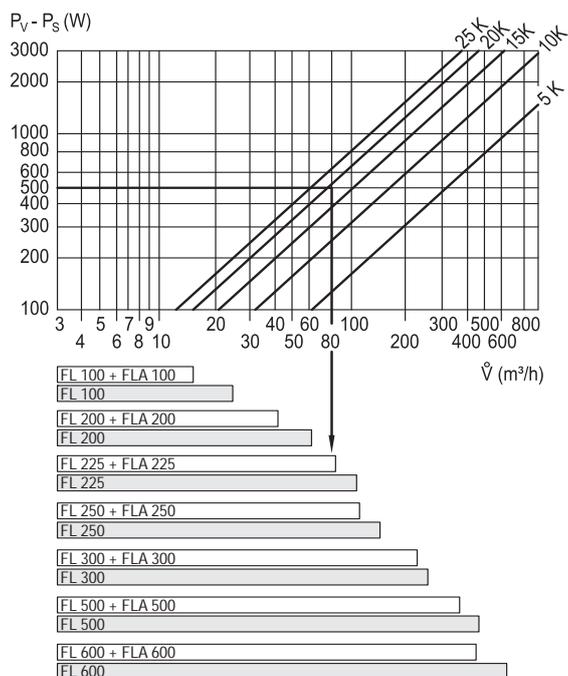

(heat that is radiated from the cabinet

without additional ventilation)

ΔT = temperature difference between the air drawn in (ambient temperature T_U) and the exhaust air (internal cabinet temperature T_i),

$$\Delta T = T_i - T_U$$

01108017

kt45245

Reading example

The devices in the cabinet produce e.g. a power loss of 840 W. Of these 840 W, the cabinet releases 340 W to the environment via its surfaces. The air sucked in from outside the cabinet has a temperature of 20 °C. A maximum temperature of 40 °C is to be permitted in the cabinet.

So which air filtered fan should be employed?

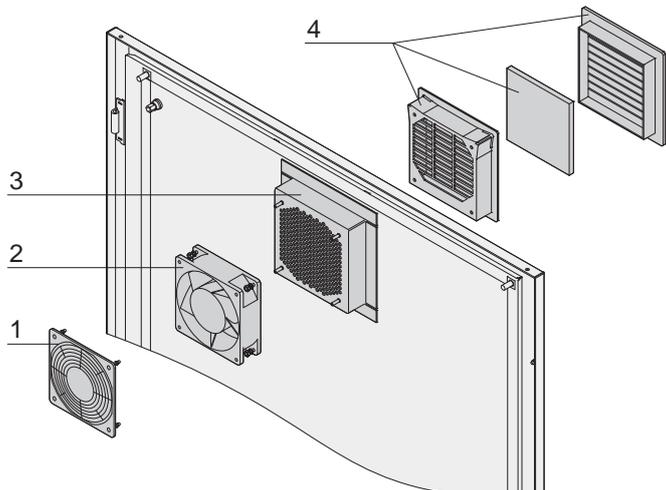

- $P_V = 840$ W, $P_S = 340$ W, read-off point $P_V - P_S = 500$ W
- $\Delta T = T_i - T_a = 40$ °C - 20 °C = 20 °C = 20 K
- On the characteristic for 20 K we obtain, at $P_V - P_S = 500$ W, a minimum necessary airflow volume of $V = 80$ m³/h.
- An FL 250 air filtered fan should be used that gives an airflow volume of 131 m³/h or, if used in combination with the FLA 250 exhaust filter, of 95 m³/h.

Fields of application

- Outdoor/Telecoms
- Telecom shelter
- Suitable to expand existing structure or for new installation
- Compact construction

Function

The cabinet air conditioner is based on a compressor transporting the heat inside the cabinet to the outside, thus keeping the internal temperature in the cabinet on the desired level and within the range of the hysteresis. The fan for the inner circuit keeps the air in the cabinet in constant circulation; the temperature is monitored by a thermostat. The thermostat activates the compressor and the external circuit fan upon reaching the required temperature.

Cooling principle

Function

A Peltier element is a thermoelectric cooler that creates a temperature difference when current is passed through it. The Peltier effect occurs where two semiconductors are placed in contact. When a current is passed through two consecutive contact points between semiconductors, cooling is obtained - with heating on the opposite side.
